

Adobe Premiere tip of the day

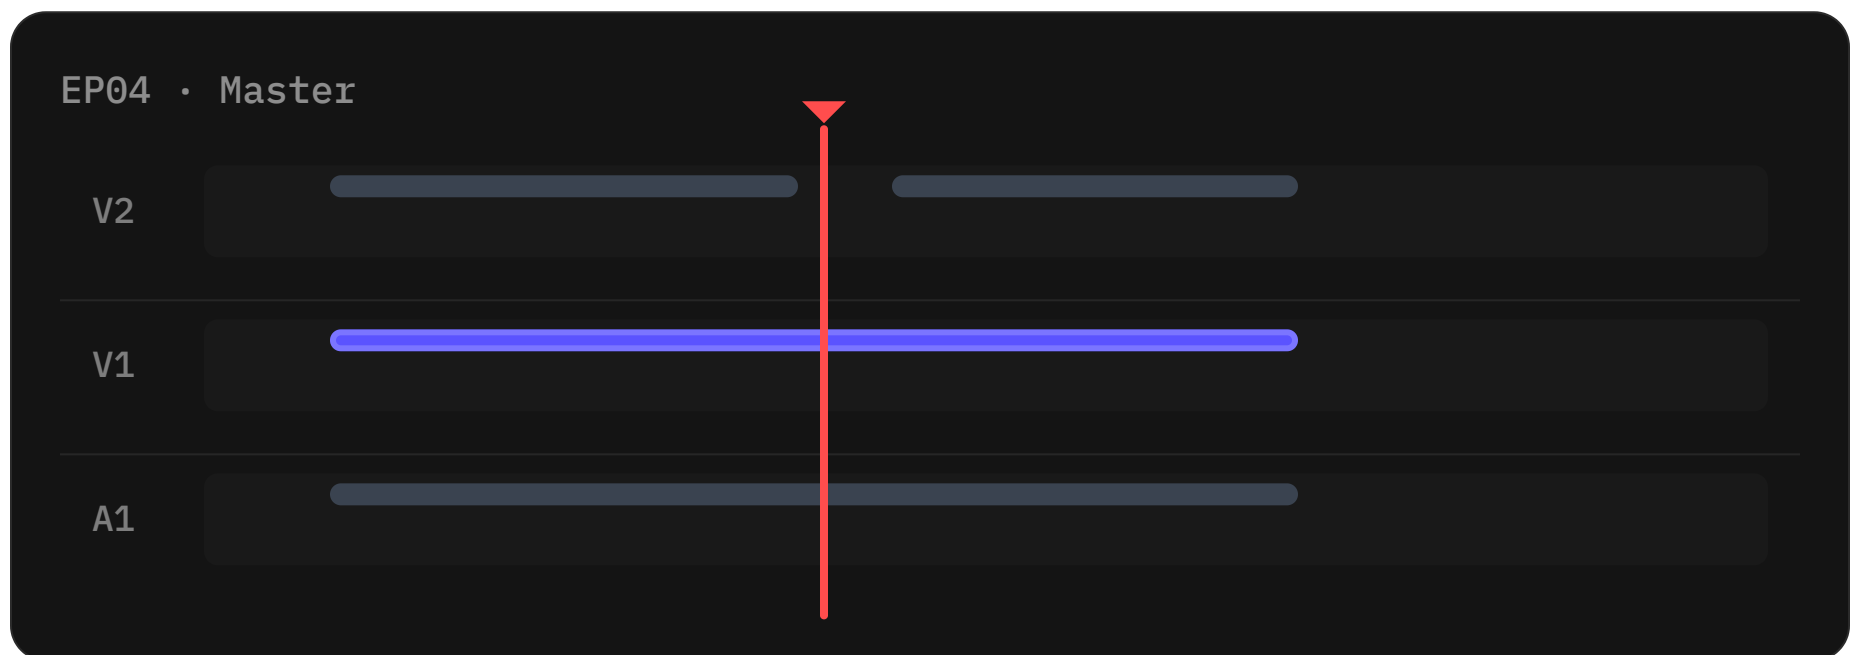

TIP 05 · [ADD](#) [EDIT](#)

Put the razor away.

TIP 05 • ADD EDIT

Cut a section out of six tracks.

 With the blade that is four careful clicks, and the one you fluff is the one you find later.

TIP 05 • ADD EDIT

 ⌘

Add an edit.

Cmd/Ctrl + K — an edit at the playhead, on the targeted track.

Cmd/Ctrl + Shift + K — on every track at once.

Never two frames out, never the wrong track, hands where they already were.

Two things worth knowing.

The order that does the whole job: **mark in, mark out, add edit to all tracks, extract.**

The blade still wins for **one quick cut** in one place. This is for everything else.

TIP 05 • ADD EDIT

Mark, then press.

The blade has cost me more re-exports than any other tool in the box.
